

Abstract of the Disclosure

In a lantern detachable cap, a clip part having a shape of circle is provided at a lower end of the extension portion formed at the connecting portion of the moving manipulate member, and a lantern is attached to and detached from the clip, the lantern has a shape of cylinder, a battery is loaded within the lantern, and an on/off switch is protruded from one side of the lantern. In addition, the clip part may comprise a pair of clips and be formed at the lower end of the extension portion of the moving manipulate member. According to the lantern detachable cap, since the lantern detachable cap has a clip part at a lower portion of a connecting portion of a moving manipulate member and a lantern attached to and detached from the clip part, the lantern can be freely attached and detached. In addition, since the detaching/attaching mechanisms of the lantern are simplified, production cost can be reduced. Moreover, since the lantern is attached to and detached from only a peak of the cap, the cap can be neatly shaped.
